## ABSTRACT

Intensive investigations of some groups of soil fauna in Šumadija were permanent more than 20 years. This central part of Serbia, has an interesting geological history. It's interesting flora and fauna partially is result of continuous anthropogenic influences in the last centuries. In these investigations were included: (Insecta, Coleoptera), Lumbricidae (Oligochaeta), and Protura and Diplura (Insecta, Apterygota). The studied ecosystems were natural (forests and meadows) and anthropogenous (orchards, gardens, fields and artificial meadows). Earthworms from family Lumbricidae, were established 14 genera with 30 taxa and 6 new species for Šumadija: *Dendrobaena alpina*, *Helodrilus cernosvitovianus*, *Octolasion cyaneum*, *Octodrilus complanatus*, *Serbiona serbica* and *Serbiona paratuleskovi*. From the subfamily Cryptorhynchinae (Curculionidae) founded 5 genera, 12 species and three dominant species: *Ruteria hypocrita*, *Echinodera behnei* and *Acallocrates colonnellii*. New records of five weevils: *Acalles (Acalles) aubei*, *Acalles papei*, *Acelles petryszaki*, *Echinodera behnei*, *Echinodera valida* are given for Serbia. From Protura founded 3 families, 7 genera with 16 species, from Diplura founded 2 families which belong to 7 genera with 16 species.

**Keywords:** Serbia, Šumadija, soil fauna

## Introduction

The middle part of Serbia is Šumadija. It is located among the rivers: Great and West Morava, Danube, and Kolubara. The most important morphological characteristics are low mountains (Rudnik, Avala, Bukulja) and wide valleys. The climate is continental with microclimatic differences.

In the first papers about lumbricids in Šumadija, Šapkarev (35) and Karaman (13, 14, 15) had cited only eight taxa. But later Šapkarev (36) had found 16 taxa (with 14 species). After mentioned period, the earthworm fauna of Šumadija has been widely studied (16, 17, 18, 19, 20, 22, 24, 29, 31, 37).

Curculionidae is the biggest recent animal family in the world. It contains about 80.000 described species (1, 26). Members of this family are predominantly remarkable by the elongate rostrum (they look like the small elephants among other beetles), by the geniculate antennae, and the small (often concealed) palpi (25). Among other possibilities, some of them chose to be soil settlements. One of those soil groups

is the subfamily Cryptorhynchinae. Common morphological characteristics of these weevils are the rostrum hidden in the gutter on prothorax between fore coxae, fore tibiae finished with a curved horn on the outside angle, upper body side covered with scales, mostly brown and grey, which make light and dark design (11).

After 30 years investigation the number of species of Diplura and Protura have to increased (5, 6, 7, 8, 9, 10).

## Materials and Methods

Our investigations were carried out in the area of Central part of Serbia (Šumadija). In the last investigations period (1996-2009) on all over the territory of Šumadija we had collected earthworm from various habitats which included natural (river banks, meadows, forest community: *Quercetum-conffertae cerris* and *Fagetum montanum*; mountain pastures) and cultivated biotops. Earthworms were collected by formalin method and digging 0,4X0,4m quadrates. Specimens were immediately fixed in 4% formalin and transferred to 90% ethanol.

The presence of adult weevils was studied during the period 1995-2007, from different types of habitats on several localities in the Central Serbia (Žeželj, Mt Gledičke planine, Mt Rudnik and Mt Bukulja). Pitfall traps with acetic-acid or red wine, sowing of the samples of superficial layer of soil (to 20 cm of depth) combined with Tulgren-Berlesse apparatus were used for collecting adult weevils' material. The identification of species was carried out in accordance with the descriptions given in the «keys» (3, 4, 11). The sex was determined for each specimen.

From the collecting entomological material individuals of *Diplura* and *Protura* (*Insecta*) were separated from samples collected and determined on usually way. The collecting of *Protura* and *Diplura* (*Insecta*) done on about more than 100 localities in Šumadija.

## Results and Discussion

During our investigations to 1995 total number of earthworms taxa which have been found in Šumadija were 37 (31). In our collection from this area, after that period (1996-2009) we have identified 30 taxa and 6 species which are new for the earthworm fauna in Šumadija: *Dendrobaena alpina*, *Helodrilus cernosvitovianus*, *Octolasion cyaneum*, *Octodrilus complanatus*, *Serbiona serbica* and *Serbiona paratuleskovi*. Therefore, the total number of lumbricid taxa of Šumadija has risen to 44. The complete list of earthworms species from Šumadija is given in the **Table1**.

The most abundant lumbricids in Šumadija is *A. rosea*, *L. rubellus* and *O. lacteum*. They are also very frequently met and distributed almost everywhere.

Most species belonging to the genera *Aporrectodea* (10 species, resp. 11 taxa) and *Dendrobaena* (8 species, resp. 9 taxa). Very interesting for the investigation territory is finding of two endemic species from genus *Serbiona*: *S. paratuleskovi* and *S. serbica*. Because it is their first finding in Šumadija we give their descriptions.

### *Allolobophora chlorotica* (Savigny 1826)

Habitat: forest soils, cultivated soils, meadows

Localities: 7exp., Jastrebac, 3.06.1995; 3exp., Jastrebac, 27.08.1995.

### *Aporrectodea caliginosa caliginosa* (Savigny 1826)

Habitat: forest soils, wet meadows

Localities: 1exp., Goč, 28.06.1999; 5exp., Goč, 01.04.1999; 13exp., Gledičke planine, 03.07.1999.

### *Aporrectodea caliginosa trapezoides* (Duges 1826)

Habitat: forest soils, cultivated soils

Localities: 1exp., Jastrebac, 03.06.1995; 2exp., Jastrebac, 27.08.95; 5exp., Goč, 28.06.1999.

### *Aporrectodea georgii* (Michaelsen 1890)

Habitat: forest soils, wet meadows

Localities: 1exp., Kraljevo, 05.04. 2008; 4exp., Kraljevo, 07.04.2008; 1exp., Kraljevo, 14.04.2008.

### *Aporrectodea rosea* (Savigny 1826)

Habitat: forest soils, cultivated soils, meadows

Localities: 2exp., Jastrebac, 03.06.1995; 4exp., Jastrebac, 27.08.95; 9exp., Kalenić, 07.06.1998; 7exp., Goč, 28.06.1999; 6exp., Goč, 01.04.1999; 28exp., Gledičkeplanine, 03.07.1999; 4exp., Duleni, 17.04.2001

### *Apporectodea sineporis* (Omodeo, 1952)

Habitat: meadows

Localities: 8 exp., Kraljevo, 23.03.2008.

### *Serbiona dofleini* (Ude 1922)

Habitat: hill pastures

Localities: 2exp., Jastrebac, 03.06.1995.

### *Serbiona kosowensis kosowensis* (Karaman 1968)

Habitat: meadows

Localities: 5exp., Goč, 28.06.1999.

### *Serbiona robusta serbica* (Karaman 1983)

Habitat: pastures

Localitiy: 1exp., Gledičke planine, 03.07.1999.

### *Serbiona paratuleskovi* (Šapkarev 1975)

Habitats: meadow

Locality: 1exp., Kragujevac, 19.04.1995.

### *Serbiona serbica* (Šapkarev 1977)

Habitats: river banks

Locality: 1exp., Rasina, 07.04.2001.

---

<i>Dendrobaena. alpina</i> (Rosa 1844)	<i>Eiseniella tetraedra tetraedra</i> (Savigny 1826)
Habitat: forest soil	Habitat: wet meadows, river bank
Locality: 1exp., Kalenić, 16.05.1995.	Localities: 7 exp., Jastrebac, 3.06.1995; 3exp., Jastrebac, 27.08.1995.
<i>Dendrobaena. attemsi</i> (Michaelsen 1903)	<i>Fitzingeria platyura platyura</i> (Fitzinger 1883).
Habitat: forest soils, meadows	Habitat: wet forest soils, river bank, meadows
Localities: 3 exp., Jastrebac, 3.06.1995; 12exp., Stolovi, 3.10.2002.	Localities: 10 exp., Jastrebac, 03.09.1995; 1exp., Goč, 28.06.1999; 4exp., Stolovi, 2.10.2002.
<i>Dendrobaena. byblica</i> (Rosa 1893)	<i>Helodrilus cernosvitovianus</i> (Zicsi 1967)
Habitat: forest soils, meadows, river bank	Habitats: forest soil
Locality: 2exp., Jastrebac, 3.06.1995.	Lokalitiy: 1exp., Bukulja, 10.05.2003.
<i>Dendrobaena hortensis</i> (Michaelsen, 1890)	<i>Lumbricus rubellus</i> Hoffmeister 1843
Habitat: forest soils, hill meadows	Habitat: forest soils, cultivated soils, meadows
Locality: 3exp., Kalenić, 07.06.1998.	Localities: 7exp., Jastrebac, 3.06.1995; 11exp., Jastrebac, 27.08.1995; 11exp., Kalenić, 07.06.1998; 6exp., Goč, 28.06.1999; 9exp., Goč, 01.04.1999; 6exp., Gledičkeplanine, 03.07.1999; 7exp., Stolovi, 02.10.2002; 12exp., Stolovi, 03.10.2002; 1exp., Rasina, 07.04.2001; 17exp., Duleni, 17.04.2001; 12exp., 26.04.2001, Baljkovac.

<i>Eisenia lucens</i> (Waga 1857)	
Habitat: forest soils, pastures	
Localities: 1 exp., Jastrebac, 03.09.1995; 2exp., Stolovi, 2.10.2002.	

*Proctodrilus antipae antipae* (Michaelsen 1891)  
Habitat: forest soils  
Localities: 1 exp, Kraljevo, 05. 04. 2008.  
Regarding the zoogeographical position of the lumbricid fauna in Šumadija, it could be said that taxa (25%) eleven are Peregrine:  
*Allolobophora chlorotica*  
*Aporrectodea caliginosa caliginosa*  
*Aporrectodea caliginosa trapezoides*  
*Aporrectodea rosea*  
*Dendrodrilus rubidus rubidus*  
*Dendrodrilus rubidus subrubicundus*  
*Eiseniella tetraedra tetraedra*  
*Lumbricus terrestris*  
*Octolasion lacteum*  
*Octolasion cyaneum*  
*Eisenia foetida*

Five taxa (11,4%) are Transaegean:  
*Aporrectodea georgii*  
*Panonica leoni*  
*Aporrectodea handlirichi*  
*Aporrectodea jassiensis*  
*Dendrobaena byblica*

Seven taxa (15,9%) are Holarctic:  
*Dendrobaena veneta veneta*  
*Dendrobaena hortensis*  
*Dendrobaena octaedra*  
*Dendrodrilus rubidus tenuis*  
*Dendrobaena attenuata*  
*Lumbricus rubellus*  
*Dendrobaena veneta zebra*

Two taxa (4,5%) are Palearctic:  
*Octodrilus transpadanus*  
*Proctodrilus tuberculatus*

Six taxa (13,6%) are European:  
*Dendrobaena alpina*  
*Aporrectodea rosea bimastoides*  
*Aporrectodea rosea interposita*  
*Fitzingeria platyura platyura*  
*Eisenia lucens*

Three taxa (6,8%) are Central European:

*Dendrobaena vejvodovskii*  
*Proctodrilus antipae*  
*Lumbricus polyphemus*

Two taxa (4,5%) are Alpino-Dinoro-Carpathian:  
*Aporrectodea sineporis*  
*Aporrectodea smaragdina*

One taxon (2,3%) is South European:  
*Octodrilus complanatus*

Three taxa (6,8%) are larger endemite:  
*Serbiona dofleini dofleini*  
*Helodrilus cernosvitovianus*  
*Serbiona kosowensis kosowensis*

Four taxa (9,1%) are endemic:  
*Dendrobaena jastrebensis*  
*Serbiona paratuleskovi*  
*Serbiona robusta serbica*  
*Serbiona serbica*

It could be said that the peregrine, holarctic and mainly european species make more than the half of the total lumbricid species in Šumadija. Endemic species take part with only 9,1% in the total number of the species. But, on the territory of wide area of Serbia (31) there are 30% endemic species. Territory of Šumadija have only four endemic species (9,1%). The real reason for this situation is that the area of Šumadija is in the strong influence by man. The low presence of endemic species indicates destroy of the forest (as the strongest influnce), accelerating the stepification of this area, also destroy microclimatic habitats.

Totally 139 adult weevils' specimens (79 males, 60 females) were collected and analyzed. After identification 12 species from five genera of Cryptorhynchinae were confirmed. Until now, five species (*Acalles (Acalles) aubei* Boheman, 1837, *Acalles papei* A.&F. Solari, 1905, *Acelles petryszaki* Dieckmann, 1982, *Echinodera behnei* Stüben, 1998, *Echinodera valida* (Hampe, 1864)) were completely unknown in Serbia. There is one species, *Rutelia graeca*, endemic to the Balcan Peninsula which find was reported for Serbia 2008 (28), but to these days that information was not noted on the site [www.faunaeur.org](http://www.faunaeur.org).

Systematic part was formed according to Alonso-Zarazaga & Lyal (1) and Alonso-Zarazaga (2).

Subfam. **Cryptorhynchinae** Schönherr, 1825

Distribution: Eastern Europe

Investigations in Šumadija were (among more others groups of invertebrates) made on hexapod (*Protura* and *Diplura*). *Protura* species prefer forest ecosystems (litter of oak, beech, elm, mixed deciduous and conifers trees) while *Diplura* (as omnivores) wide spread (in forest, in meadow, in agroecosystems) which depend from the food.

From *Protura* found 16 species, which belong to 3 families:

#### Family Acerentomidae:

*Acerentomon balcanicum* Ionescu, 1933;  
*Acerentomon parvum* Szeptycki, 1980;  
*Acerentomon quercinum* Ionescu, 1932;  
*Acerentulus traegardhi* Ionescu, 1937;  
*Acerentulus catalanus* Condé, 1951;  
*Acerentulus exiguus* Condé, 1944;  
*Acerentulus gerezianus* da Cunha, 1952;  
*Acerella muscorum* (Ionescu, 1930);  
*Gracilentulus gracilis* Berlese, 1908;  
*Gracilentulus meridianus* Condé, 1945.

#### Family Eosentomidae:

*Eosentomon delicatum* Gisin, 1945;  
*Eosentomon germanicum* Prell, 1912;  
*Eosentomon transitorium* Berlese, 1908;  
*Eosentomon coiffaiti* Condé, 1961.

#### Family Protentomidae:

*Hesperentomon carpaticum* Ionescu, 1930;  
*Proturentomon minimum* Berlese, 1908.

From *Diplura* fauned 16 species, which belong to two families:

#### Family Campodeidae:

*Campodea (Campodea) colladoi* Silvestri, 1939;  
*Campodea (Campodea) silvestrii* Baagnall, 1932;  
*Campodea (Campodea) wallacei* Baagnall., 1918;  
*Campodea (Dicampa) campestre* Ionescu, 1955;  
*Campodea (Dicampa) frenata* Silvestri, 1931;  
*Campodea (Dicampa) malpighii* Silvestri, 1912;

*Campodea (Dicampa) silvicola* Wygodzinsky, 1940;  
*Campodea (Paurocampus) rocasolanoi* Silvestri, 1932;  
*Campodea (Paurocampus) suensonii* Tuxen, 1930;  
*Podocampa serbica* Karaman & Blesić 1983;  
*Plusiocampa rudnica* Blesić, 1992.

#### Family Japygidae:

*Catajapyx confussus* Silvestri, 1932;  
*Japyx solifugus* Silvestri, 1903;  
*Metajapyx gojkovici* Pages, 1953;  
*Metajapyx seratus* Stach 1929;  
*Protojapyx maior* Silvestri, 1932.

TABLE 1

Complete list of the earthworm species of Šumadija

<u>Fam. LUMBRICIDAE</u> Udekem, 1855	
<b>gen. Allolobophora</b> Eisen, 1874	
	- <i>A. chlorotica</i> (Savigny 1826)
<b>gen. Aporrectodea</b> Oerley 1856	
	- <i>A. caliginosa caliginosa</i> (Savigny 1826)

## Conclusions

In the last investigations period (1996-2009) on all territory of Šumadija authors collected earthworm from various habitats on plane, hill and partly mountain regions in Šumadija. We have found 30 taxa and six species which are new for the earthworm fauna in Šumadija: *Dendrobaena alpina*, *Helodrilus cernosvitovianus*, *Octolasion cyaneum*, *Octodrilus complanatus*, *Serbiona serbica* and *Serbiona paratuleskovi*.

The greatest number of species belongs to the genera: *Apporrectodea* (10 species, resp. 11 taxa), *Dendrobaena* (8 species, resp. 9 taxa), *Serbiona* (5 species). The most frequent species were *Aporrectodea rosea*, *Lumbricus rubellus* and *Octolasion lacteum*.

Zoogeographically it could be said that in the composition

on the lumbricid fauna from Šumadija are eleven taxa (25%) are Peregrine, five (11,4%) are Transaegean, seven (15,9%) are Holarctic, two (4,5%) are Palearctic, six taxa (13,6%) are European, three (6,8%) are Central European, two (4,5%) are Alpino-Dinoro-Carpathian, one taxon (2,3%) is South European, three taxa (6,8%) are larger endemite and four taxa (9,1%) are endemic. Low presence of endemic species indicated strong antropogenic influence and a very few presence of a real natural biotopes in Šumadija.

The first data about finding of five weevil's species *Acalles (Acalles) aubei*, *Acalles papei*, *Acelles petryszaki*, *Echinodera behnei*, *Echinodera valida* on the territory of Serbia are recorded.

After 30 years investigation *Protura* and *Diplura* the number of species have to increased on 32 species, from *Protura* founded 16 species and from *Diplura* also 16 species.
